Management of small projects under the repercussions of the global financial crisis

-An applied study on a sample of small projects in Kingdom of Bahrain

Prepared By: Sakeena Hassan Ali

Supervised By: Dr. Atheelah Yaseen Azzawi

Abstract

This study aimed to clarify the problem of managing small businesses under the impact of the global financial crisis.

The researcher found that the descriptive analysis tools and procedures are perfect to understand the nature of the problem and the research objective and its sample.

The deductive approach was used by the researcher to find the relationship between the global financial crisis and the management of small businesses, finding the different views in the answers of the questionnaire about the impact of the global financial crisis and the management of the small businesses according to their demographic characteristics.
The questionnaire contains 60 questions and was distributed to 38 random small businesses (Trade, Industry, Construction, Tourism, Services, Real estate).

The results proved the relationship between the global financial crisis and the management of small businesses in the kingdom of Bahrain.

Also the researcher concluded several recommendations: the small businesses in Bahrain were the least effected by the global financial crisis and it's the safest due to the conservative policies used by the Kingdom in managing small businesses, therefore it's obligated to maintain that level of performance by using alternative solutions that achieve the national interest for the fear of recurrence of the global financial crisis.
